

MERGING DATAFRAMES WITH PANDAS

Reading multiple data files

Tools for pandas data import

- pd.read_csv() for CSV files
 - dataframe = pd.read_csv(filepath)
 - dozens of optional input parameters
- Other data import tools:
 - pd.read excel()
 - pd.read html()
 - pd.read_json()

Loading separate files

```
In [1]: import pandas as pd
In [2]: dataframe0 = pd.read_csv('sales-jan-2015.csv')
In [3]: dataframe1 = pd.read_csv('sales-feb-2015.csv')
```

Using a loop

Using a comprehension

```
In [7]: filenames = ['sales-jan-2015.csv', 'sales-feb-2015.csv']
In [8]: dataframes = [pd.read_csv(f) for f in filenames]
```

Using glob

```
In [9]: from glob import glob
In [10]: filenames = glob('sales*.csv')
In [11]: dataframes = [pd.read_csv(f) for f in filenames]
```

MERGING DATAFRAMES WITH PANDAS

Let's practice!

MERGING DATAFRAMES WITH PANDAS

Reindexing DataFrames

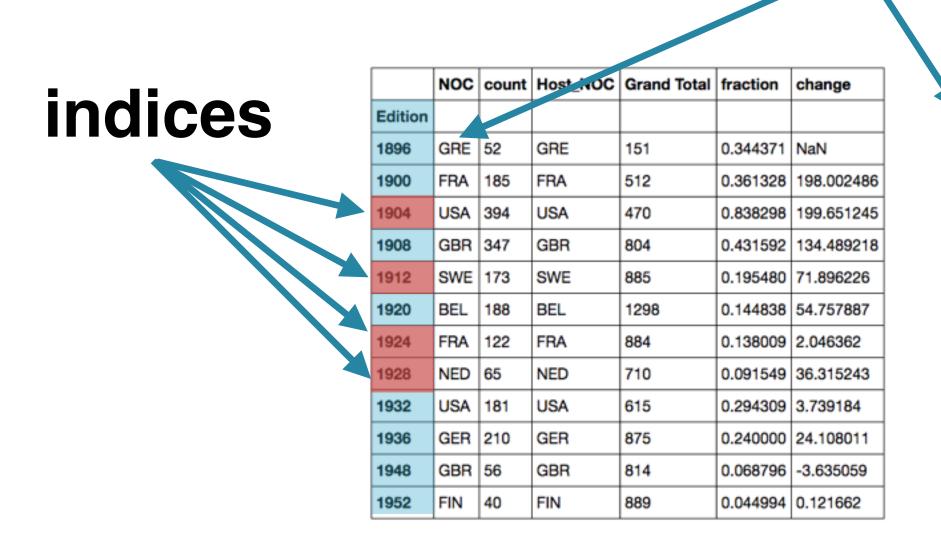

"Indexes" vs. "Indices"

- indices: many index labels within Index data structures
- indexes: many pandas Index data structures

indexes

NOC	AFG	АНО	ALG	ANZ	ARG	ARM	 VEN	VIE	YUG	ZAM	ZIM	zzx
Edition												
1896	NaN	NaN	NaN	NaN	NaN	NaN	 NaN	NaN	NaN	NaN	NaN	NaN
1900	NaN	NaN	NaN	NaN	NaN	NaN	 NaN	NaN	NaN	NaN	NaN	33.561198
1904	NaN	NaN	NaN	NaN	NaN	NaN	 NaN	NaN	NaN	NaN	NaN	-22.642384
1908	NaN	NaN	NaN	NaN	NaN	NaN	 NaN	NaN	NaN	NaN	NaN	0.000000
1912	NaN	NaN	NaN	-26.092774	NaN	NaN	 NaN	NaN	NaN	NaN	NaN	0.000000
1920	NaN	NaN	NaN	0.000000	NaN	NaN	 NaN	NaN	NaN	NaN	NaN	0.000000
1924	NaN	NaN	NaN	0.000000	NaN	NaN	 NaN	NaN	NaN	NaN	NaN	0.000000
1928	NaN	NaN	NaN	0.000000	131.101152	NaN	 NaN	NaN	323.521127	NaN	NaN	0.000000
1932	NaN	NaN	NaN	0.000000	-25.794206	NaN	 NaN	NaN	0.000000	NaN	NaN	0.000000
1936	NaN	NaN	NaN	0.000000	-10.271982	NaN	 NaN	NaN	-29.357594	NaN	NaN	0.000000
1948	NaN	NaN	NaN	0.000000	-4.601500	NaN	 NaN	NaN	47.596769	NaN	NaN	0.000000
1952	NaN	NaN	NaN	0.000000	-10.508545	NaN	 NaN	NaN	34.043608	NaN	NaN	0.000000

Importing weather data

```
In [1]: import pandas as pd
In [2]: w_mean = pd.read_csv('quarterly_mean_temp.csv', index_col='Month')
In [3]: w_max = pd.read_csv('quarterly_max_temp.csv', index_col='Month')
```

Examining the data

```
In [4]: print(w_mean)
       Mean TemperatureF
Month
                61.956044
Apr
Jan
                32.133333
Jul
                68.934783
Oct
                43.434783
   [5]: print(w_max)
       Max TemperatureF
Month
                      68
Jan
Apr
                      89
Jul
                      91
Oct
                      84
```

The DataFrame indexes

```
In [6]: print(w_mean.index)
Index(['Apr', 'Jan', 'Jul', 'Oct'], dtype='object', name='Month')
In [7]: print(w_max.index)
Index(['Jan', 'Apr', 'Jul', 'Oct'], dtype='object', name='Month')
In [8]: print(type(w_mean.index))
<class 'pandas.indexes.base.Index'>
```

Using.reindex()

Using.sort_index()

Reindex from a DataFrame Index

Reindexing with missing labels

Reindex from a DataFrame Index

```
In [16]: w_max.reindex(w_mean3.index)
Out[16]:
       Max TemperatureF
Month
                   68.0
Jan
                   89.0
Apr
                     NaN
Dec
   [17]: w_max.reindex(w_mean3.index).dropna()
Out[17]:
       Max TemperatureF
Month
                   68.0
Jan
                   89.0
Apr
```

Order matters

```
In [18]: w_max.reindex(w_mean.index)
Out[18]:
       Max TemperatureF
Month
Apr
                      89
                      68
Jan
Jul
                      91
Oct
                      84
In [19]: w_mean.reindex(w_max.index)
Out[19]:
       Mean TemperatureF
Month
Jan
                32.133333
                61.956044
Apr
                68.934783
Jul
                43.434783
Oct
```

```

Let's practice!

Appending & concatenating Series

append()

- append(): Series & DataFrame method
- Invocation:
 - s1.append(s2)
- Stacks rows of s2 below s1
- Method for Series & DataFrames

concat()

- concat(): pandas module function
- Invocation:
 - pd.concat([s1, s2, s3])
- Can stack row-wise or column-wise

concat() & .append()

- Equivalence of concat() & .append():
 - result1 = pd.concat([s1, s2, s3])
 - result2 = s1.append(s2).append(s3)
- result1 == result2 elementwise

Series of US states

```
In [1]: import pandas as pd
In [2]: northeast = pd.Series(['CT', 'ME', 'MA', 'NH', 'RI', 'VT',
   ...: 'NJ', 'NY', 'PA'])
In [3]: south = pd.Series(['DE', 'FL', 'GA', 'MD', 'NC', 'SC', 'VA',
   ...: 'DC', 'WV', 'AL', 'KY', 'MS', 'TN', 'AR', 'LA', 'OK', 'TX'])
In [4]: midwest = pd.Series(['IL', 'IN', 'MN', 'MO', 'NE', 'ND',
   ...: 'SD', 'IA', 'KS', 'MI', 'OH', 'WI'])
In [5]: west = pd.Series(['AZ', 'CO', 'ID', 'MT', 'NV', 'NM',

```

pd.concat() with dict

Let's practice!

Outer & inner joins

Using with arrays

```
In [1]: import numpy as np
In [2]: import pandas as pd
In [3]: A = np.arange(8).reshape(2,4) + 0.1
In [4]: print(A)
[[ 0.1 1.1 2.1 3.1]
 [ 4.1 5.1 6.1 7.1]]
In [5]: B = np.arange(6).reshape(2,3) + 0.2
In [6]:print(B)
[[ 0.2 1.2 2.2]
 [ 3.2 4.2 5.2]]
In [7]: C = np.arange(12).reshape(3,4) + 0.3
In [8]: print(C)
   0.3
         1.3
                   3.3]
               2.3
   4.3
         5.3
             6.3
                   7.3]
 [ 8.3 9.3 10.3 11.3]]
```

Stacking arrays horizontally

Stacking arrays vertically

```
In [8]: np.vstack([A, C])
Out[8]:
array([[ 0.1, 1.1, 2.1, 3.1],
      [4.1, 5.1, 6.1, 7.1],
      [0.3, 1.3, 2.3, 3.3],
      [4.3, 5.3, 6.3, 7.3],
      [ 8.3, 9.3, 10.3, 11.3]])
In [9]: np.concatenate([A, C], axis=0)
Out[9]:
array([[ 0.1, 1.1, 2.1, 3.1],
       4.1, 5.1, 6.1, 7.1
       0.3, 1.3, 2.3, 3.3],
       4.3, 5.3, 6.3, 7.3],
              9.3, 10.3, 11.3]])
        8.3,
```

Incompatible array dimensions

```
In [11]: np.concatenate([A, B], axis=0) # incompatible columns
ValueError
                                          Traceback (most recent call last)
---> 1 np.concatenate([A, B], axis=0) # incompatible columns
ValueError: all the input array dimensions except for the concatenation axis must match
exactly
In [12]: np.concatenate([A, C], axis=1) # incompatible rows
ValueError
                                          Traceback (most recent call last)
---> 1 np.concatenate([A, C], axis=1) # incompatible rows
ValueError: all the input array dimensions except for the concatenation axis must match
exactly
```

Population & unemployment data

```
In [13]: population = pd.read_csv('population_00.csv',
                                   index_col=0)
    . . . .
In [14]: unemployment = pd.read_csv('unemployment_00.csv',
                                      ...index_col=0)
In [15]: print(population)
               2010 Census Population
Zip Code ZCTA
57538
                                   322

               0.33
80808
               0.07
                              4310
```

Converting to arrays

```
In [17]: population_array = np.array(population)
  [18]: print(population_array) # Index info is lost
   322]
    130]
 [40038]
 [45199]]
In [19]: unemployment_array = np.array(unemployment)
   [20]: print(population_array)
    1.10000000e-01 3.44470000e+04
    2.0000000e-02 4.8000000e+03]
                    4.20000000e+01]
    3.3000000e-01
                    4.31000000e+03]
    7.0000000e-02
```

Manipulating data as arrays

Joins

- Joining tables: Combining rows of multiple tables
- Outer join
 - Union of index sets (all labels, no repetition)
 - Missing fields filled with NaN
- Inner join
 - Intersection of index sets (only common labels)

Concatenation & inner join

Concatenation & outer join

```
In [23]: pd.concat([population, unemployment], axis=1, join='outer')
Out[23]:
       2010 Census Population unemployment participants
                           NaN

             Germany
                       454.0
                                407.0
```

Merging with left join

- Keeps all rows of the left DF in the merged DF
- For rows in the left DF with matches in the right DF:
 - Non-joining columns of right DF are appended to left DF
- For rows in the left DF with no matches in the right DF:
 - Non-joining columns are filled with nulls

Merging with left join

```
In [7]: pd.merge(bronze, gold, on=['NOC', 'Country'],
               suffixes=['_bronze', '_gold'], how='left')

```

Which should you use?

- df1.append(df2): stacking vertically
- pd.concat([df1, df2]):
 - stacking many horizontally or vertically
 - simple inner/outer joins on Indexes
- df1.join(df2): inner/outer/left/right joins on Indexes
- pd.merge([df1, df2]): many joins on multiple columns

MERGING DATAFRAMES WITH PANDAS

Let's practice!

Ordered merges

Software & hardware sales

Software & hardware sales

```

Reminder: loading & merging files

- pd.read_csv() (& its many options)
- Looping over files, e.g.,
 - [pd.read_csv(f) for f in glob('*.csv')]
- Concatenating & appending, e.g.,
 - pd.concat([df1, df2], axis=0)
 - df1.append(df2)

Let's practice!
